Novel anti-trkC agonist monoclonal antibody useful for treating neurodegenerative disease, shows no significant cross-reactivity with trkA/trkB, and recognizes epitope in domain 5 of trkC.

Claim 38; Fig 28; 121pp; English.

The invention relates to an anti-trkC agonist monoclonal antibody which shows no significant cross-reactivity with trkA or trkB, and recognizes

an epitope in domain 5 of trKC. The antibodies of the invention are effective in the treatment of cisplatin- or pyridoxine-induced neuropathy, peripheral neuropathy, diabetic neuropathy and large-fibre sensory neuropathy, neurodegenerative disease including amyotrophic lateral sclerosis, nerve cell injuries, disorders of insufficient blood cells such as leukopaenia including eosinopaenia, basopaenia, lymphopaenia, monocytopaenia, neuropaenia, Alzheiner's disease, lymphopaenia, monocytopaenia, neuropaenia, Alzheiner's disease, lorkinson's disease, Huntington's disease and tumours. The sequences also useful for inducing angiogenesis for treating wounds, ulcers and diabetic complications of sickle cell disease, for treating cardiac ischaemia and cerebrovascular disorders and in the diagnosis of diseases involving cellular degeneration. Sequences ARK24399-ABKA4413 represent antibodies and antibody fragments of the invention

```

The invention relates to a human monoclonal antibody or its antigen-binding protein which specifically binds alpha1(IV) NCI collagen and a hybridoma cell line that produces the F1.1 monoclonal antibody. The human monoclonal antibody or its antigen-binding protein that specifically binds alpha1(IV) NCI collagen is useful for preparing compositions for treating or preventing human anti-glomerular basement membrane autoantibody disease (anti-GBM disease). The sequences can also be used for producing a mouse model for anti-GBM disease, for inducing anti-GBM disease in a mouse and for screening or identifying compositions for treating or preventing one or more symptoms of anti-GBM disease. This sequence represents obNA encoding a human monoclonal antibody F1.1 (Mab F1.1) heavy chain variable region. Claim 13; Page 61; 80pp; English.

The invention provides a neuromodulatory agent (I) capable of promoting neurite outgrowth, regeneration, remyelination and neuroprotection in central nervous system (CMS). (I) is capable of inducing remyelination, promoting callular proliferation of glial cells, and promoting Ca2+ signaling with oligodenfrocytes. An humanised antibody to (I) can be selected from antibody sHIGMS2 (LMM 22), ebvHigM MSIJBIO, ebv HIGM CB2bG8, AKMR4, CB2iBI2, CB2iET or MSIJBES. (I) is useful for stimulating remyelination of CNS axons, or treating demyelinating proliferation of glial cells in CMS axons, or treating demyelinating disease of CNS in a mammal in need of such therapy. (I) is capable of blinding to structures and cells within CNS. (I) is preferably useful for treating a demyelinating disease of CNS of a mouse infected with Strain DA of Theiler's murine encephalomyelitis (TMEW) or for treating a human being having multiple sclerosis, or a

human or domestic animal with a viral demyelinating disease, or a postneural disease of CNS. (1) is also useful for an in vitro method of stimulating the proliferation of glial calls from mixed cell culture. (1) is also useful for stimulating remyelination of CNS axons. The antibodies are useful for preventing infection by a bacterium, virus or like pathogen that causes demyelination or other neurodegenerative condition in a subject. Methods where (1) is administered to a patient are useful for treating multiple sclerosis, Parkinson's disease, Alzheimer's disease, amyotrophic lateral sclerosis (ALS), a viral demyelinating disease, CNS diseases, and other conditions in the CNS where nerves are damaged as by trauma. The present sequence represents the ebvHigh MSI19910 heavy chain variable region nucleotide sequence

This invention relates to a novel humanised, chimeric or human monoclonal antibody or its antigen binding portion that specifically binds to contibody or its antigen binding portion that specifically binds to contibody or its antigen binding of IGP-IR. The antibodies of the invention can act as an inhibitor of binding of IGP-I or IGP-II with IGP-IR phosphorylation. The antibodies of the invention are useful for the antibody or its antigen-binding portion is also useful for chargener in a human. The method for this further involves an antice complexit, anti-tumour, anti-angiogenic or chemotherapeutic agent. The antibodies may also be useful for increasing IGP-IR activity and thus continuous in IR activity and condition characterised by low IGP-IR cereivity in a condition characterised by low IGP-IR cereivity in a condition characterised by low IGP-IR activity in a condition characterised by Iow IGP-IR cereivity in a condition characterised by Iow IGP-IR also useful for inducing apoptosis of specific cells in a patient, and to creat non-canecrous states or disease, e.g. acromegaly, gigantism, concanecrous states or disease, e.g. acromegaly, gigantism, concanecrous states or disease, e.g. acromegaly, gigantism, or concansis and atherosclerosis Pully human anti-IGP-IR antibodies or mouse-derivatised monoclonal antibodies and thus increase the efficacy and safety of the administered antibodies. The present sequence receptor antibody of the invention Novel humanized, chimeric monoclonal antibody that specifically binds to insulin-like growth factor I (IGF-1) receptor useful for inhibiting binding of IGF-I or IGF-II to receptor and for treating cancer in humans. This is the nucleotide sequence of the heavy chain variable region (VH)

gene from a dominant clone, termed 4d68, of B-cells taken from the

cerebrospinal fluid (CSF) of a multiple sciencis (WB) patient. Sequences

of VH of CSF B-cells were obtained from 4 MS patients (see AAX25316-19).

Differences in nucleotide and predicted amino acid (see AAY05691-94)

Sequences were compared with the closest known germline VH genes; for
4d68, this was ML. The results provided direct vidence that intrathecal

clonally expanded B-cells from the CSF of MS patients are hypermutated

postgerminal centre antibody-forming or memory lymphocytes that havd

undergone antigen selection. This finding implicates an important

pathogenic pathway for the development of demyelination in CNS of MS. The

invention provides assay kits for determining B-cell or T-cell clonality.

This technology allows the establishment of clonal specific RNA library

from pathogenic cells in the CNS of patients, which is important for

curcher understanding of the role of antigen specific therapeutic

clonal expansion, and towards developing antigen specific therapeutic 71 ACCTGCGCTGTCTCTGGGGCTCTGTCAGCAGTAGTAACTGGTGGACCTGGATCCGCCAG 130 61 ACCTGCGCTGTCTCTGGTGGCTCCATCAGCAGTAGTAACTGGTGGAGTTGGGTCGCCCAG 120 131 CCCCCAGGGAAGGGACTGGAGTGGACGTATCTCTGGTAGTGGTGGGGCCACCAAC 190 121 CCCCCAGGGAAGGGCTGGAGTGGGAAATCTATCATA---GTGGGAGCACCAAC 177 191 TACAACCOGTCCCTCAAGAGTOGAGTCATCATTTCACAAGACACGTCCAAGAACCAGTTC 250 2 9 11 CAGCTGCAGCTGCAGAGTCGGGCCCCAGGAGTGGTGAAGCCTTCGGAGACCCTGTCCCTC Gaps Score 241; DB 2; Length 294; Pred. Anti-IGF-IR antibody VH chain DNA consensus sequence #2.

This invention relates to a novel humanised, chimeric or human monoclonal antibody or its antigen binding portion that specifically binds to insulini-like growth factor I receptor (167-18). The antibodies of the invention can act as an inhibitor of binding of 16F-IR tyrosine.

IR and can inhibit in vivo tumour growth and IGF-IR tyrosine of phosphorylation. The antibodies of the invention are useful for diagnosing the presence or location of an IGF-IR expressing tumour in a subject. The antibody or its antigen-binding portion is also useful for treating cancer in a human. The method for this further involves an antipodoies may also be useful for increasing IGF-IR activity in a condition characterised by low IGF-IR restoring IGF-IR activity in a condition characterised by low IGF-IR levels e.g. neuropathy, or osteoporosis. An antibody of the invention is also useful for inducing apoptosis of specific cells in a patient, and to treat non-cancerous states or disease, e.g. acromegaly, gigantism, psoriasis and atherosclerosis. Pully human anti-IGF-IR antibodies minimise the immunogenic and allergic responses intrinsic to mouse or mouse-derivatised monoclonal antibodies and thus increase the efficacy and safety of the administered antibodies. The present sequence repersents a DNA sequence encoding an anti-insulin-like growth factor I creceptor antibody of the invention Novel humanized, chimeric monoclonal antibody that specifically binds to insulin-like growth factor I (IGF-1) receptor useful for inhibiting binding of IGF-I or IGF-II to receptor and for treating cancer in humans. The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from the human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 to probes. Also included are a microarray comprising the novel set of probes; the novel set of probes which Mybridise at high stringency to a nucleic acid expressed in the human lung, measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the agorithmically predicting at least one exon from genomic sequences of the array; identifying exons in a ewaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the ewing a fragment identical to the predicted exon, the probe is included thaving a fragment identical to the predicted exon, the probe is included the above mentioned microarray; assigning exons the probe is included comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of the exons in several

tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types indicates that the expression of the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the composition of the stands (DRF). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human analysis, and for identifying exons in a gene, particularly using human concern, chronic obstructive pulmonary fluoresesses such as asthma, lung cancer, chronic obstructive pulmonary fluoreses (CDPP), interstitial lung disease (LLD), familial idiopathic pulmonary fluoresis, neurofibromatosis, tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-cholars, rymdrome, sarcoidosis, pulmonary alveolar proteinosis, histocytosis, lymphangioleiomyconicosis, pulmonary alveolar proteinosis, Kazagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a single exon probe open reading frame of the present exception, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pot_sequences

```
The invention relates to a novel chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40. The anti-CD40 antibody of the invention demonstrates cytostatic, virucide, antibocterial, immunostimulant and anti-HIV activities and may be useful for treating a hyperproliferative disorder combined immunodeficiancy conditions including neutropenia or HIV infection. The anti-CD40 antibodies may also be useful for detecting CD40 in a biological sample in vitro or in vivo, as well as during gene therapy procedures. The current sequence is that of the human anti-CD40 antibody mutant variable region heavy chain cDNA of the invention.
                                                                                                                                                                                     New chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40, useful for enhancing an immune response in a human, or treating cancer, HIV, neutropenia or viral infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TCCCTGAACCTGAACTCTGTGACCGCCGCGGACACGGCCGTGTATTACTGTGCCAGAGAT 310

New specific binding members capable of binding an intracellular antigen, useful in the treatment and diagnosis of tumors.

Disclosure, Page 64; 70pp; English

The present DNA sequence is related to human antibody clone NHS76. NHS76 is useful for targeting the necrotic centres of malignant tumours by binding to human histone H1 and other intracellular antigens. The specific binding members based on the CDRS (complementarity determining regions) of NHS76 can be used in diagnosis and treatment of tumours like cervical, ovarian, prostate, lung, liver, pancreatic, colon and stomach tumours. Note: There is no relevant information regarding this sequence in the specification

RESULT 13 දු දු ሪ 2 2 B 8 8 8 & The present sequence encodes human antibody clone NHS76 heavy chain variable region. This is useful for targeting the necrotic centres of malignant tumours by binding to human histone Hi and other intracellular antigens. The NHS76 VH gene can be used in the construction of expression vectors. The specific binding members based on the CDRs (Complementarity determining regions) of NHS76 can be used in diagnosis and treatment of tumours like cervical, ovarian, prostate, lung, liver, pancreatic, colon and scommach tumours. The antibody is labelled with functional labels such active drugs at the site of a tumour New specific binding members capable of binding an intracellular antigen, useful in the treatment and diagnosis of tumors. Human antibody clone NHS76 VH, VH, heavy chain variable region, cytostatic, malignant tumour; buman histone Hl, antibody, intracellular antigen; diagnosis; treatment; tumour; cervical; ovarian; prostate; lung; liver; pancreatic; colon; stomach; prodrug; ds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the

activities and may be useful for treating a hyperproliferative disorder such as cancer, viral and bacterial infection or genetic, primary or combined immunodeficiency conditions including neutropenia or HIV infection. The anti-CD40 antibodies may also be useful for detecting CD40 in a biological sample in vitro or in vivo, as well as during gene therapy procedures. The current sequence is that of the human anti-CD40 antibody full length heavy chain cDNA of the invention.
                                                                                                                                                                                                                                                                                                                          190

```
The invention relates to a novel chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40. The anti-CD40 antibody of the invention demonstrates cytostatic, virucide, antibacterial, immunostimulant and anti-HIV such as cancer, virucide, antibacterial, immunostimulant and anti-HIV such as cancer, viral and bacterial infection or genetic, primary or combined immunodeficiency conditions including neutropenia or HIV infection. The anti-CD40 antibodies may also be useful for detecting CD40 in a biological sample in vitro or in vivo, as well as during gene therapy procedures. The current sequence is that of the human anti-CD40 antibody full length heavy chain cDNA of the invention.
                                                                           New chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40, useful for enhancing an immune response in a human, or treating cancer, HIV, neutropenia or viral infections.
                                                                                                                                                                                                     Claim 24; SEQ ID NO 61; 177pp; English
